

## Best Practices for Cove Heater Installation

### Installation Hardware:

- Use toggle bolts that can withstand the weight of the heater
  - Install the heater in the ceiling studs
- Use lever nuts for connections versus wire nuts
  - This will ensure the longevity of the connection

### Position:

- Ceiling mount heaters: recommended in the middle of the room which will have the best chance to equally heat the room
  - Heaters can also go over a window to help offset the cold from the window
- If you have multiple heaters, place the heaters an equal distance apart to ensure equal distribution of heat
- If you are wall mounting, be sure to leave 6" in between the top of the heater and the ceiling per manufacturer instructions
- If you have a sloped ceiling (shed, cathedral, etc.) position the heaters horizontally versus vertically. The steep incline is not recommended for installation.

### Thermostat:

- Thermostat should be installed in the "line of sight" of the heater
- Out of direct sunlight
- On an interior wall
